

Question 1: How do you retrieve data from an Entry widget?

To retrieve data from an Entry widget, you can use the `get()` method, which will return the current contents of the text field as a string. This helps get user input, which you can then store and perform other operations with later on in the program/

Question 2: When you retrieve a value from an Entry widget, of what data type is it?

When retrieving value from an Entry widget, it is in a string data type. Even if the input is a number, the widget will still return it as a string, so if you input in 21, the widget returns "21".

Question 3: What module is the StringVar class in?

The StringVar class is in the tkinter module, as whenever importing the class, you always do `'from tkinter import StringVar'`, indicating that the class is within the tkinter module.

Question 4: What can you accomplish by associating a StringVar object with a Label widget?

By associating a StringVar object with a Label widget, you are enabling dynamic text updates. This means that the label will automatically update its display without you needing to change anything about the widget, which makes it really easy if you ever want to change the UI around later in your project.
